Lista sem gabarito

Karen dos Anjos Arcoverde

1 Questão 1

(a)

A matriz A é similar a matriz B se, e somente se, existe uma matriz inversível tal que:

$$A = P \cdot B \cdot P^{-1}$$

Pelo enunciado, sabemos que:

$$A = Q \cdot R \tag{1}$$

$$B = R \cdot Q \tag{2}$$

Utilizando a equação (2):

$$B = R \cdot Q$$

Como Q é ortogonal, então $Q^{-1} = Q^T$, assim Q^{-1} existe:

$$B \cdot Q^{-1} = R \cdot Q \cdot Q^{-1}$$

$$B \cdot Q^{-1} = R \tag{3}$$

Substituindo (3) em (1):

$$A = Q \cdot B \cdot Q^{-1}$$

Dessa forma, A e B são similares.

(b)

O método utilizado para a decomposição QR foi o de Gram-Schmidt.
Sabendo que a matriz A composta por $R \cdot Q$, onde A, Q e R são da forma:

$$A = \begin{pmatrix} | & | & | & | \\ a_1 & a_2 & a_3 & a_4 \\ | & | & | & | \\ | & | & | & | \end{pmatrix}$$

$$Q = \begin{pmatrix} | & | & | & | \\ q_1 & q_2 & q_3 & q_4 \\ | & | & | & | \\ | & | & | & | \end{pmatrix}$$

$$R = \begin{pmatrix} q_1^T \cdot a_1 & q_1^T \cdot a_2 & q_1^T \cdot a_3 & q_1^T \cdot a_4 \\ 0 & q_2^T \cdot a_2 & q_2^T \cdot a_3 & q_2^T \cdot a_4 \\ 0 & 0 & q_3^T \cdot a_3 & q_3^T \cdot a_4 \\ 0 & 0 & 0 & q_4^T \cdot a_4 \end{pmatrix}$$

Considerando que cada coluna da matriz A é um vetor com nome a_1, a_2, a_3, a_4 e cada coluna da matriz Q serão os 4 vetores ortonormais encontrados em cada iteração (q_1, q_2, q_3, q_4) de modo que na primeira iteração teremos os dados fornecidos pelo professor:

$$a_1 = \begin{pmatrix} 0.7140299 \\ 0.6918437 \\ 0.6748934 \\ 0.7884872 \end{pmatrix}$$

$$a_2 = \begin{pmatrix} 0.6918437 \\ 1.2492256 \\ 1.0307285 \\ 0.6275049 \end{pmatrix}$$

$$a_3 = \begin{pmatrix} 0.6748934 \\ 1.0307285 \\ 1.0893471 \\ 0.5567456 \end{pmatrix}$$

$$a_4 = \begin{pmatrix} 0.7884872 \\ 0.6275049 \\ 0.5567456 \\ 0.9550583 \end{pmatrix}$$

Sabendo que a norma de um vetor $u \in R^n$ é o número real $\|u\|_2 = \sqrt{<u,u>}$. Então, segue-se o seguinte algoritmo:

1. $q_1 = \frac{a_1}{\|a_1\|_2}$

2. $q_2' = \left(I - q_1 \cdot q_1^T\right) a_2 = a_2 - q_1 \cdot q_1^T a_2$

3. $q_2 = \frac{q_2'}{\|q_2\|_2}$

4. $q_3' = \left(I - q_1 \cdot q_1^T - q_2 \cdot q_2^T\right) a_3 = a_3 - q_1 \cdot q_1^T a_3 - q_2 \cdot q_2^T a_3$

5. $q_3 = \frac{q_3'}{\|q_3\|_2}$

6. $q_4' = \left(I - q_1 \cdot q_1^T - q_2 \cdot q_2^T - q_3 \cdot q_3^T\right) a_4 = a_4 - q_1 \cdot q_1^T a_4 - q_2 \cdot q_2^T a_4 - q_3 \cdot q_3^T \cdot a_4$

7. $q_4 = \frac{q_4'}{\|q_4'\|_2}$

8. $R = \begin{pmatrix} q_1^T \cdot a_1 & q_1^T \cdot a_2 & q_1^T \cdot a_3 & q_1^T \cdot a_4 \\ 0 & q_2^T \cdot a_2 & q_2^T \cdot a_3 & q_2^T \cdot a_4 \\ 0 & 0 & q_3^T \cdot a_3 & q_3^T \cdot a_4 \\ 0 & 0 & 0 & q_4^T \cdot a_4 \end{pmatrix}$

9. $Q = \begin{pmatrix} | & | & | & | \\ q_1 & q_2 & q_3 & q_4 \\ | & | & | & | \\ | & | & | & | \end{pmatrix}$

10. $A = R \cdot Q$

Na próxima iteração, as matrizes-colunas de A (a_1, a_2, a_3, a_4) mudarão, de forma que cada matriz-coluna de A será igual a cada matriz-coluna de $R \cdot Q$.

Fez-se várias vezes as iterações até que na quinta iteração, os valores na diagonal principal da matriz $R \cdot Q$ ficarão iguais aos da quarta iteração.

1° Iteração:

```

Somente na 5° Iteração os valores da diagonal principal de $R \cdot Q$ são iguais aos da 4° Iteração com aproximação de 4 casas decimais e a matriz $R \cdot Q$ se tornou uma triangular superior, uma vez que todos os valores abaixo da diagonal principal são próximos de zero em 4 casas decimais. De forma que os autovalores da matriz A são revelados, arredondando em 4 casas decimais: 3.2219, 0.6423, 0.1424, 0.0011.
